

第 3 节（SDD强化训练）： Sub-Agents 角...

我们第一周的项目 ai-knowledge-base/v1-skeleton 有三个 Agent：

```
1 collector    →    analyzer    →    organizer
2 (采集)          (分析)          (整理)
```

当 collector 抛异常时 analyzer 怎么办？analyzer 的输出长什么样 organizer 才能读？这些是 Agent 间的依赖关系和验收标准，用自然语言提示词表达会漏，必须拆成带依赖的显式任务。

本节我们来装 Matt Pocock 的第二个 skill——**to-issues**——把高阶 PRD 展开成一组带依赖和验收的 **issue 任务票**，每个 Agent 一份。

预备知识

- [老项目逆向 · 改哪里 spec 补到哪里](#)

环境准备

Claude Code

```
1 npx skills@latest add mattpocock/skills/to-issues -a claude-code
2 ls ~/.claude/skills/      # grill-me / to-issues 都在
3
```

OpenCode (推荐)

```
1 npx skills@latest add mattpocock/skills/to-issues -a opencode
2 ls ~/.agents/skills/
```

本节目标

为 v1-skeleton 的三个 Agent 产出：

1. `specs/agents-prd.md` —— 一份**高阶 PRD**，写清 3 个 Agent 的职责和协作流
2. `specs/issues/01-collector.md` / `02-analyzer.md` / `03-organizer.md` —— 三份 **issue 任务票**，每份含 `depends_on` / `acceptance` / `schema`
3. `.opencode/agents/{collector,analyzer,organizer}.md` —— 三个 Agent 配置文件，从 issue 派生

双路并行

这个双路并行的设计是为了比较自己和 AI 聊和有 SDD 思想/工具做指导的差异。

A 路 • Vibe • 10 分钟

复制下面的Prompt让AI做：

```
1 我在做 AI 知识库, 有 collector / analyzer / organizer 三个 agent。
2 帮我写 .opencode/agents/ 下的 3 个角色定义文件。
3 数据流: collector 抓 GitHub Trending → analyzer 打标签 → organizer 输出 MD。
```

有什么踩坑点呢？

三个 Agent 各自知道自己要做什么，但**谁先谁后、谁触发谁、失败怎么办**都在空气里。测试时，你会发现 analyzer 在 collector 还没写完时就启动了。

B 路 • SDD • 40 分钟

阶段 1 • Specify (10 分钟)

先写一份高阶 PRD (`specs/agents-prd.md`)，强制自己想清“协作”两个字：

```
1  # AI 知识库 • 三 Agent PRD v0.1
2
3  ## 总流程
4  每天 UTC 0:00 触发 • collector → analyzer → organizer • 串行。
5
6  ## Agent 职责
7  - collector: 抓 GitHub Trending Top 50 • 过滤 AI 相关 • 存 knowledge/raw/
8  - analyzer: 读 raw • 给每条打 3 维度标签
9  - organizer: 读已标注 • 整理成 MD
10
11 ## 开放问题 ( ? 用 to-issues 细化成任务 )
12 - 上游失败下游怎么办？
13 - 数据怎么传？文件 or 消息？
14 - 重跑策略？
15 - 进度追踪？
```

这里同样故意留下几个 `?`。下阶段让 to-issues 展开成任务票。

阶段 2 • Clarify (20 分钟)

to-issues 的作用不是追问 (那是 grill-me)，是把高阶 PRD 展开成一组带依赖和验收标准的 issue 任务票——每个 Agent 一份。

提示词：

```
1 使用 to-issues skill, 基于 specs/agents-prd.md 拆成 issues。
```

产出示例 (`specs/issues/02-analyzer.md`)：

OC | agents-prd.md 拆分为 is: x + v

I'll present my proposed breakdown and quiz them per the skill instructions.

我已阅读 PRD。根据 to-issues skill 流程，先提出我的拆分方案供你审查：

Proposed Vertical Slices

#	Title	Type	Blocked by	User stories covered
1	Scaffold & JSON Schema Contracts	HITL	None	项目骨架、schemas/raw.json + schemas/tagged.json 作为 Agent 间可执行契约、共享 idempotency/--force runner 基座
2	Collector Agent	AFK	#1	抓 GitHub Trending Top 50 → 过滤 AI 相关 → 存 knowledge/raw/{date}.json → 幂等跳过 / --force 重跑
3	Analyzer Agent	AFK	#1, #2	读 raw → 打 3 维标签(tech/innovation/difficulty) → 存 knowledge/tagged/{date}.json → 幂等 + force
4	Organizer Agent	AFK	#1, #3	读 tagged → 整理成 knowledge/articles/{date}.md → 幂等 + force
5	Pipeline Orchestration & Error Handling	AFK	#2, #3, #4	串行编排 collector→analyzer→organizer、上游失败下游跳过、进度追踪、重跑策略

Build DeepSeek V4 Pro DeepSeek

***** esc interrupt 15.9K (2%) · \$0.04 ctrl+p commands

OC | agents-prd.md 拆分为 is: x + v

Let me now create the final 3-issue breakdown:

- Collector Agent + Project Scaffold (AFK) - Sets up project structure, schemas, implements collector
- Blocked by: None
- Analyzer Agent (AFK) - Implements analyzer
- Blocked by: #1
- Organizer Agent + Pipeline Wiring (AFK) - Implements organizer, wires pipeline, handles failures
- Blocked by: #2

Wait, but the skill says "For each approved slice, create a GitHub issue using gh issue create". Let me first check if there's an existing repo/remote to create issues on.

Let me check the git remote first.

Got it - 3 issues, using .done files. The schema fields are clear enough from the PRD so I'll go AFK on that too.

Here's the final breakdown before I create the issues:

#	Title	Type	Blocked by
1	Collector Agent + Project Scaffold	AFK	None
2	Analyzer Agent	AFK	#1
3	Organizer Agent + Pipeline Wiring	AFK	#2

Build DeepSeek V4 Pro DeepSeek

18.8K (2%) · \$0.07 ctrl+p commands

```
OC | agents-prd.md 拆分为 is: x + v
# Create issue #3: Organizer + Pipeline Wiring

$ gh issue create --repo huangjia2019/sdd-in-action --title "Organizer Agent + Pipeline Wiring" --body "$(cat
<<'EOF'
## What to build

Implement the **organizer** agent - the final step of the daily pipeline - and wire all three agents together
into a complete orchestrated workflow. The organizer reads the analyzer's tagged output and generates a human-
readable markdown article at 'knowledge/articles/{date}.md'.

This slice also delivers the pipeline runner that executes collector → analyzer → organizer in sequence, and
handles the open questions from the PRD: upstream failure handling, progress tracking, and rerun strategy.

**End-to-end flow**: runner triggers → collector → (on success) analyzer → (on success) organizer → report
completion status. If any agent fails (`.failed` marker detected), downstream agents are skipped.

## Scope

- Organizer agent script with CLI entry point
- Markdown article generator (transforms tagged JSON into readable `.md`)
- Pipeline runner/orchestrator script
- Upstream failure propagation: if collector writes `.failed`, analyzer and organizer skip
- Progress tracking: clear console output showing which agent is running, skipped, or failed
- Rerun strategy: `--force` on the runner propagates to all three agents, clearing all markers before starting
fresh

## Acceptance criteria

- [ ] Running the organizer reads `knowledge/tagged/{date}.json` and produces `knowledge/articles/{date}.md`
- [ ] The generated `.md` article is well-structured and human-readable (headings, links to repos, labeled tags)

EOF"

## Blocked by

- Blocked by #2 (needs both collector and analyzer agent implementations)
EOF
)"

https://github.com/huangjia2019/sdd-in-action/issues/3

Thinking: All 3 issues created. Let me summarize for the user.

3 份 issues 已创建完成：

| # | Title                              | Blocked by | URL                                                                                                                                |
|---|------------------------------------|------------|------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Collector Agent + Project Scaffold | None       | #1 ( <a href="https://github.com/huangjia2019/sdd-in-action/issues/1">https://github.com/huangjia2019/sdd-in-action/issues/1</a> ) |
| 2 | Analyzer Agent                     | #1         | #2 ( <a href="https://github.com/huangjia2019/sdd-in-action/issues/2">https://github.com/huangjia2019/sdd-in-action/issues/2</a> ) |
| 3 | Organizer Agent + Pipeline Wiring  | #2         | #3 ( <a href="https://github.com/huangjia2019/sdd-in-action/issues/3">https://github.com/huangjia2019/sdd-in-action/issues/3</a> ) |

拆分逻辑：
- #1 - 项目骨架 + schemas + collector, 建立共享的 idempotency/--force 模块
- #2 - analyzer: 读 raw → 打标签 → 存 tagged, 验证上游契约
- #3 - organizer + 完整编排：生成 .md 文章 + pipeline runner (串行执行、上游失败下游跳过、进度追踪、--force 传播重跑)

Build · DeepSeek V4 Pro · 5m 25s

Build DeepSeek V4 Pro DeepSeek
18.8K (2%) · $0.07 ctrl+p commands
```

阶段 3 • Implement (10 分钟)

从 issue 派生 `.opencode/agents/{collector,analyzer,organizer}.md` ——每个 Agent 配置文件直接引用对应 issue 作为职责说明。

A vs B 对比

维度	A 路	B 路
耗时	10 min	40 min
协作依赖	口头约定	Issue 的 <code>depends_on</code> 字段
验收标准	主观判断	Issue 的 <code>acceptance</code> checklist
failure 场景	跑一次才发现	Issue 规划时就覆盖
新人理解成本	读 3 个文件	读 PRD + 3 份 issue

多 Agent = 多依赖。依赖必须显式化成 issue 的 `depends_on`，验收必须显式化成 `acceptance` ——**任务票才有真相源。**

完成清单

- `specs/agents-prd.md` (高阶 PRD)
- `specs/issues/{01-collector, 02-analyzer, 03-organizer}.md` (3 份 issue · 带 `depends_on` + `acceptance`)
- `specs/schemas/*.json` (2 份可执行 schema · 从 issue 的 `acceptance` 派生)
- `.opencode/agents/{collector, analyzer, organizer}.md` (从 issue 派生)

你也可以同时使用 `prd-to-plan`，`grill-me` 的组合，提升规范质量。

下一节

第 4 节 Skills 能力封装 —— 三个 Agent 的骨架有了。但 collector 真正的“技能”藏在 `skills/github-trending/SKILL.md` 里。下节引入 **write-a-skill**，让 AI 用 SDD 方式帮你从零聊出一份可复用 SKILL.md。这是 Week 1 的收官节，敬请期待。
